CSS Nightmare Meds for Backend Devs

I wouldn't say I like HTML and CSS tweaking. Thanks to ChatGPT and its siblings, backend devs are no longer talking to human designers who always seem to find ways to screw up code with fancy CSS crap. Yep, they do. They break your code blocks, and eventually, you pull out each other's hair. So, I have listed a few CSS frameworks that work well for non-frontend devs.

AI REVIEW PASSED.

matcha.css – ideal for fast prototyping

matcha.css is a pure CSS library designed to style HTML elements similarly to a default browser stylesheet, eliminating users needing to patch their documents manually. It is ideal for fast prototyping, static HTML pages, Markdown-generated documents, and developers seeking to streamline their workflow without delving into CSS intricacies and want to use the full range of available HTML elements.

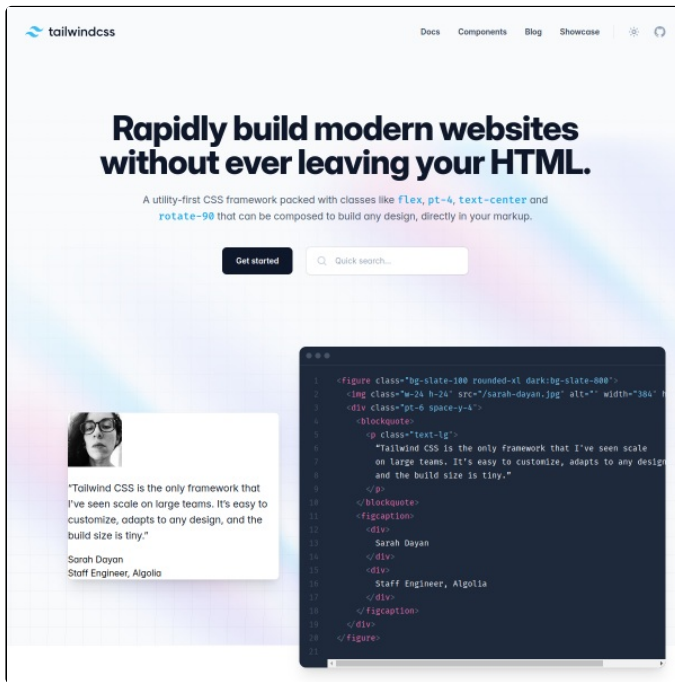

DISCLAIMER

I have yet to use it.

Tailwind.css – my favorite

A utility-first CSS framework packed with classes like flex, pt-4, text-center and rotate-90 that can be composed to build any design, directly in your markup.

Bootstrap.css – the fallback for admin UI

I have used this as a fallback framework for developing admin backends.

Foundation.css – our legacy framework

We have used foundation CSS for so many enterprise apps that we are now unwinding them as we can.
