CSS Nightmare Meds for Backend Devs

I wouldn't say I like HTML and CSS tweaking. Thanks to ChatGPT and its siblings, backend devs are no longer talking to human designers who always seem to find ways to screw up code with fancy CSS crap. Yep, they do. They break your code blocks, and eventually, you pull out each other's hair. So, I have listed a few CSS frameworks that work well for non-frontend devs.

AI REVIEW PASSED.

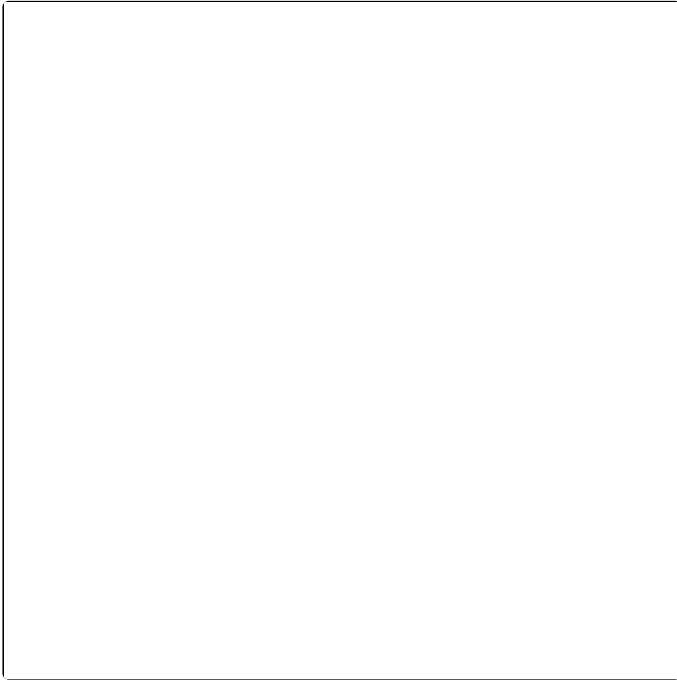

Tailwind.css – my favorite

A utility-first CSS framework packed with classes like flex, pt-4, text-center and rotate-90 that can be composed to build any design, directly in your markup.

Bootstrap.css - the fallback for admin UI

I have used this as a fallback framework for developing admin backends.

Foundation.css - our legacy framework

We have used foundation CSS for so many enterprise apps that we are now unwinding them as we can.
